

Contents

1	Quantum Measurement Theory	7
1.1	Classical Measurement Theory	7
1.1.1	Understanding Bayes' theorem	9
1.1.2	Multiple measurements and Gaussian distributions	11
1.1.3	Prior states-of-knowledge and invariance	14
1.2	Quantum Measurement Theory	17
1.2.1	The measurement postulate	17
1.2.2	Quantum states-of-knowledge: density matrices	17
1.2.3	Quantum measurements	20
1.3	Understanding Quantum Measurements	25
1.3.1	Relationship to classical measurements	25
1.3.2	Incomplete measurements and Bayesian inference	26
1.3.3	The polar decomposition: bare measurements and feedback	27
1.4	Inefficient Measurements	30
1.5	Measurements on Ensembles of States	31
2	Useful Concepts from Information Theory	35
2.1	Quantifying Information	35
2.1.1	The entropy	35
2.1.2	The mutual information	39
2.2	Quantifying Uncertainty About a Quantum System	41
2.2.1	The von Neumann entropy	41
2.2.2	Majorization and Density Matrices	44
2.2.3	Ensembles corresponding to a density matrix	48
2.3	Quantum Measurements and Information	50
2.3.1	Information theoretic properties	50
2.3.2	Quantifying Disturbance	57
2.4	Distinguishing Quantum States	62
2.5	Fidelity of Quantum Operations	66

3	Continuous Measurement and Estimation	71
3.1	Continuous Measurements I	71
3.1.1	Classical continuous measurements	71
3.1.2	Quantum continuous measurements with Gaussian noise . .	76
3.2	Solving for the Evolution: the Linear Form of the SME	84
3.2.1	The dynamics of measurement: diffusion gradients	88
3.2.2	Quantum jumps	90
3.2.3	Distinguishing quantum from classical	92
3.2.4	Continuous measurements on ensembles of systems	94
3.3	Continuous Measurements II: Counting Events	95
3.3.1	Photon counting	97
3.3.2	From counting events to Gaussian measurements	101
3.3.3	Continuous Measurements and Levy processes	104
3.4	The Hybrid Master Equation	104
3.4.1	An example: distinguishing two quantum states	107
